U.S. Patent and Trademark Office
Washington D.C. 20231

Dear Sirs,

I am requesting a patent for the K-9-Protector. My idea is to convert a motion sensor security light using the wires that turn this light on whenever the motion sensor is activated by someone or something to operate a tape recorder, which would have a tape in it with two vicious barking dogs recorded on this tape. This tape plays for 60 seconds then starts over again as long as the power is on, it is an endless tape that never stops but this does not matter as the barking dogs always sound the same.

Background of the idea.

Other sensors are connected to a center where police are notified and the person or persons involved have no way of knowing they are immediately being noticed as he does, with the noise from the vicious barking dogs. The tape player would be inside the house with the barking dogs turned on loud enough to be heard outside.

Summary of the invention

The idea is cheap, it is available and easy to make. It can be put on a tree, a post, or the wall, as long as you have electricity to hook it up and it is high enough to not get damaged.

Brief description of the pictures

The pictures show parts required on two different pages with numbers in different places but explained in the next description.

Description of the preferred embodiment

Figure 1: Pictures page 1 and 2

Shows the body of the motion sensor, it is activated by a motion in its range, it can be armed or pointed to cover the range required, but it only has a certain range.

Figure 2: Picture page 1

A picture of the body of the sensor showing three adjusting switches.

They are 1 - a sensitivity switch

2 - a day light switch

3 - a time switch

- Figure 3: Picture page 2
Shows a tape player with the wires coming in through the wall to a plug but the wire could come in through the wall to an incoming electrical plug (not shown).
- Figure 4: Pictures page 1 and 2
Shows the tape to use, this tape only plays for 60 seconds and plays the same thing over again but this does not matter because the barking dogs sound always the same. It never stops playing, it is an endless tape and only stops when the power is no longer on.
- Figure 5: Picture page 2
Shows the wire running from the sensor through a hole in the wall and back to the tape player.
- Figure 6: Picture page 1 and 2
Shows the light fixtures attached to the monitor and the power from one of these runs the tape player, but the light fixtures could be removed with only the wire left here to operate the tape player. It would be better without lights but can be left if desired.

Claims

A motion sensor with lights attached is made to turn lights on whenever anyone or anything approaches it, and as can be seen in pictures page 1 and pictures page 2. The light fixtures can be removed so that the intruder does not know that he, or it, is being monitored, but lights can be left on if preferred but the person inside can see outside better to take evasive action. The barking of dogs inside would not bother neighbours because it would only be heard close by. So you can set it and forget it.

Abstract of the disclosure

A motion sensor security light

Some electrical wire to hook up a tape player

An endless tape

The motion sensor security light changed from turning lights to turning a tape player on.

Find enclosed a cheque for \$200.00.

Yours truly,
